Criminalistics: Forensic Science and Crime gives readers an in-depth overview of this hot-button topic and explores the various tasks and actions that take place in crime scenes and laboratories all across the world today. Presents more than twenty great experiments--broken into topics such as blood and guts, eyewitness accounts, and physical evidence--that allow students to use real CSI techniques to find clues, analyze the data, and come to their own conclusions. The Daubert trilogy of U.S. Supreme Court cases has established that scientific expert testimony must be based on science grounded in empirical research. As such, greater scrutiny is being placed on questioned document examination generally, and handwriting comparison in particular. Bridging the gap between theory and practice, The Neuroscience of CSI has been heralded in many spheres of public discourse as a televisual revolution, its effects on the public unprecedented. The CSI Effect: Television, Crime, and Governance demonstrates that CSI's appeal cannot be disentangled from either its production as a televisual text or the broader discourses and practices that circulate within our social landscape. This interdisciplinary collection bridges the gap between the study of media, particularly popular culture media, and the study of crime. The objective of Document Analysis and Recognition (DAR) is to recognize the text and graphical components of a document and to extract information. With first papers dating back to the 1960's, DAR is a mature but still growing research field with consolidated and known techniques. Optical Character Recognition (OCR) engines are some of the most widely recognized products of the research in this field, while broader DAR techniques are nowadays studied and applied to other industrial and office automation systems. In the machine learning community, one of the most widely known search problems addressed in DAR is recognition of unconstrained handwritten characters which has been frequently used in the past as a benchmark for evaluating machine learning algorithms, especially supervised classifiers. However, developing a DAR system is a complex engineering task that involves the integration of multiple techniques into an organic framework. A reader may feel that the use of machine learning algorithms is not appropriate for other DAR tasks than character recognition. On the contrary, such algorithms have been massively used for nearly all the tasks in DAR. With large emphasis being devoted to character recognition and word recognition, other tasks such as pre-processing, layout analysis, character segmentation, and signature verification have also benefited much from machine learning algorithms. Fundamentals of Forensic Science, Third Edition, provides current case studies that reflect the ways professional forensic scientists work, not how forensic academicians teach. Written by two of the leading experts in forensic science today, the book approaches the field from a truly unique and exciting perspective, giving readers a new understanding and appreciation for crime scenes as recent pieces of history, each with evidence that tells a story.
